Japan

Item 3c)

For social inclusion, it is important to capture the vulnerable population by sound data. SDG indicators should be disaggregated by age, sex and many other properties notably disability status. Based on the SDG principle, Japan inserted internationally recognised disability measurement such as Washington Group short set of disability questions or EuroStat question on GALI (Global Activity Limitation Indicator) in the national basic statistics of household sample surveys. To enable the region to advance the social inclusion, Japan-ESCAP Cooperation Fund are used for activities such as creating gender sensitive guidelines to include vulnerable population with disability, and suffered from disaster or building e-learning platform.
