Open Data use cases
Data use promotion

• Different channels to promote the use of data

• At the subnational level, our main target are state and local governments

• We work with the local committees of statistical and geographical information that are headed by a representative of the local government

• INEGI can help to build the statistical and geographical capacities of the state public servants thru courses and workshops

• Depending on their capacities, INEGI can also help them to develop their data visualizations that combines INEGI data and their own data
Seguridad Jalisco
Is a map with information of the places with the highest incidence of crime
It integrates data from the local Prosecutor's Office and from different sources, including INEGI, and curated by the Jalisco statistical and geographical office.
Another visualization developed in the state of Jalisco show the main macroeconomic indicators of the state and their comparison with the rest of the country.

They publish data from different federal sources with a state focus.
Benefits

• This type of visualizations gives the citizens the opportunity to have access to the information of his state in a simpler way, since at the national level the local vision is diluted.

• Having access to open data allows local governments to access information in a simple way, without the hassle of having to sign any type of contract, which makes the time in which the information is available to users more efficient.
The municipality of Apodaca is part of the second largest urban area of México.
With the help of INEGI, developed a tool called Smart Apodaca, where citizens can visualize the different services like community centers, police stations, etc.
Combine with statistical data like population.
Use Google maps API to access the street view
Using our current data visualization platforms, we build additional layers to visualize the impact of the covid-19 pandemic.
The tool integrates data from INEGI that is available for download as Open Data.
It also integrates open data from other sources, mainly from the Health Minister that is updated daily.
Benefits

The availability of this data allow us to integrate it on our platform very fast and put online a tool where any user is able to find in open data format all the indicators that INEGI specialists consider may be useful in different contexts for analyzing the pandemic.
