	- rural	2014	7.2					26.4					

a Unless specifically mentioned, all the data used in the tables are from the ESCAP statistical database. Available from www.unescap.org/stat/data/statdb/DataExplorer.aspx. With regard to aggregation methods, aggregate values are presented for subregional, regional, special economic and world groupings. World aggregates are taken directly from the data source when available. Subregional, regional and economic groupings have been calculated using ESCAP country groupings to ensure consistency throughout. Some aggregates have been calculated by agencies responsible for the compilation and production of indicators under their area of expertise. These include some education indicators (aggregates calculated by the UNESCO Institute for Statistics). In such cases, the methodology may differ from the methods described below; additional information may be obtained from the respective agencies.

The calculation of aggregates involves three steps: (a) determining whether "enough" data are available (at least two thirds of the population for social indicators, and at least two thirds of GDP for economic indicators); (b) imputing missing values (not employed for all indicators); and (c) calculating the aggregate sum or weighted average.
